                                                                                The invention relates to novel methods and compositions for promoting the growth of bowel tissue and pancreatic islets, involving the use of a vertebrate glueagon like peptide-2 (GLP-2) or an intestinctrophic analogue thereof which incorporates at least 1 amino acid addition, deletion or substitution, or an amino acid with an N- or C-terminal amino acid blocking group. The compositions can be used in the treatment of diabetes or gastrointestinal diseases. The present sequence represents human GLP-2 which can be used in the process

                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                             This peptide is a specifically claimed example of an analogue of a human CC glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at CC least one amino acid substitution selected from: (a) incorporation at CC position 2 and/or 3 of an amino acid which renders the analogue resistant CC to cleavage by DPP-IV enzyme; (b) incorporation at position 10 of an amino acid which is oxidatively stable; and (c) incorporation at position CC amino acid which is oxidatively stable; and (c) incorporation at position CC promoting properties and can be used for treating conditions resulting CC from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract CC mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption CC syndromes; and diseases and conditions caused by loss of small bowel mucosal function particularly in patients undergone resection of the GLP-2 analogues may be administered to patients with malabsorption CC disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP-2 analogues can be up CC to 10 to even 100 times more potent than GLP-2 analogues can be up
                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                              This peptide is a specifically claimed example of an analogue of a human CC glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at CC least one amino acid substitution selected from: (a) incorporation at CC position 2 and/or 3 of an amino acid which renders the analogue resistant CC contents of the contents of the contents of an amino acid which is oxidatively stable; and (c) incorporation at position CC amino acid which is oxidatively stable; and (c) incorporation at position CC 20 of an amino acid other than Arg. The peptides have intestinal growth CC promoting properties and can be used for treating conditions resulting CC from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract CC mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption CC syndromes; and diseases and conditions caused by loss of small bowel CC mucosal function particularly in patients undergoing extended parenteral CC small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. CC disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP-2 analogues can be up CC to 10 to even 100 times more potent than GLP-2 analogues can be up
                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC This peptide is a specifically claimed example of an analogue of a human CC glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at CC least one amino acid substitution selected from: (a) incorporation at CC position 2 and/or 3 of an amino acid which renders the analogue resistant CC to cleavage by DEP-IV enzyme; (b) incorporation at position 2 amino acid which is oxidatively stable; and (c) incorporation at position CC 20 of an amino acid other than Arg. The peptides have intestinal growth CC promoting properties and can be used for treating conditions resulting CC from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract CC mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption CC syndromes; and diseases and conditions caused by loss of small bowel mucosal function particularly in patients undergoing extended parenteral CC feeding or who, as a result of surgery, have undergone resection of the cmall bowel and suffer from short-gut syndrome and cul-de-sac syndrome. CC GLP-2 analogues may be administered to patients with malabsorption CC the nutritional status of such patients. The GLP- 2 analogues can be up CC to 10 to even 100 times more potent than GLP-2
                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       micosal function particularly in patients undergoing extended parenteral feeding or who, as a result of surgery, have undergone resection of the small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. GLP-2 analogues may be administered to patients with malabsorption disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP- 2 analogues can be up to 10 to even 100 times more potent than GLP-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       promoting properties and can be used for treating conditions resulting from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption syndromes; and diseases and conditions caused by loss of small bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to cleavage by DPP-IV enzyme; (b) incorporation at position 10 of an amino acid which is oxidatively stable; and (c) incorporation at position at position acid other than Arg. The peptides have intestinal groups of an amino acid other than Arg. The peptides have intestinal groups of an amino acid other than Arg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This peptide is a specifically claimed example of an analogue of a human glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at least one amino acid substitution selectted from: (a) incorporation at position 2 and/or 3 of an amino acid which renders the analogue resistant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                promoting activity, used for to growth or loss of such tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens
                                                                                                          Glucagon-like peptide-2 analogue; GLP-2; intestinotrophic activity; intestinal tissue; growth factor; small bowl disorder; impaired growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New glucagon-like peptide-2 analogues - having intestinal growth promoting activity, used for treating conditions resulting from impaired

The peptides have intestinal growth promoting properties and can be used for treating conditions resulting from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract mucosa, which include ulcers and inflammatory disorders; congenital or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        acquired digestion and absorption disorders including malabsorption syndromes; and diseases and conditions caused by loss of small bowel mucosal function particularly in patients undergoing extended parenteral feeding or who, as a result of surgery, have undergone resection of the small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. GIP-2 analogues may be administered to patients with malabsorption disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GIP-2 analogues can be up to 10 to even 100 times more potent than GLP-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 10; Page 30; 38pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New glucagon-like peptide-2 analogues - having intestinal growth promoting activity, used for treating conditions resulting from impaired growth or loss of such tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-MAY-1998

The peptides have intestinal growth promoting properties and can be used for treating conditions resulting from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption syndromes; and diseases and conditions caused by loss of small bowel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mucosal function particularly in patients undergoing extended parenteral feeding or who, as a result of surgery, have undergone resection of the small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. GLP-2 analogues may be administered to patients with malabsorption disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP- 2 analogues can be up to 10 to even 100 times more potent than GLP-2

They can be used for treating conditions marked by abnormalities in the small intestinal tract mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption syndromes; and diseases and conditions caused by loss of small bowel mucosal function particularly in patients undergoing extended parenteral feeding or who, as a result of surgery, have undergone resection of the small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. GLP-2 analogues may be administered to patients with malabsorption disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP-2 analogues can be up to 10 to even 100 times more potent than GLP-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at least one amino acid substitution selected from: (a) incorporation at position 2 and/or 3 of an amino acid which renders the analogue resistant to cleavage by DPP-IV enzyme; (b) incorporation at position 10 of an amino acid which is oxidatively stable; and (c) incorporation at position 20 of an amino acid other than Arg. The peptides have intestinal growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  promoting properties and can be used for treating conditions resulting from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption syndromes; and diseases and conditions caused by loss of small bowel mucosal function particularly in patients undergoing extended parenteral feeding or who, as a result of surgery, have undergone resection of the small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. GLP-2 analogues may be administered to patients with malabsorption disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP-2 analogues can be up
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glucagon-like peptide-2 analogues - having intestinal growth promoting activity, used for treating conditions resulting from impaired growth or loss of such tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Glucagon-like peptide-2 analogue; GLP-2; intestinotrophic activity; intestinal tissue; growth factor; small bowl disorder; impaired growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to cleavage by DPP-IV enzyme; (b) incorporation at position 10 of an amino acid which is oxidatively stable; and (c) incorporation at position 20 of an amino acid other than Arg. The peptides have intestinal growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This peptide is a specifically claimed example of an analogue of a human glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               least one amino acid substitution selected from: (a) incorporation at consistion 2 and/or 3 of an amino acid which renders the analogue resistant to cleavage by DPP-IV enzyme; (b) incorporation at position 10 of an amino acid which is oxidatively stable; and (c) incorporation at position 20 of an amino acid other than Arg. The peptides have intestinal growth comorting properties and can be used for treating conditions resulting from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption syndromes; and diseases and conditions caused by loss of small bowel mucosal function particularly in patients undergoing extended parenteral feeding or who, as a result of surgery, have undergone resection of the small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. CliP-2 analogues may be administered to patients with malabsorption clisorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP- 2 analogues can be up
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This peptide is a specifically claimed example of an analogue of a human CC glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at CC least one amino acid substitution selected from: (a) incorporation at CC position 2 and/or 3 of an amino acid which renders the analogue resistant CC to cleavage by DPP-IV enzyme; (b) incorporation at position 10 of an CC amino acid which is oxidatively stable; and (c) incorporation at position CC 20 of an amino acid other than Arg. The peptides have intestinal growth CC promoting properties and can be used for treating conditions resulting CC from the impaired growth or loss of such tissue. They can be used for CC treating conditions marked by abnormalities in the small intestinal tract CC mucosa, which include ulcers and inflammatory disorders; congenital or CC acquired digestion and absorption disorders including malabsorption CC syndromes; and diseases and conditions caused by loss of small bowel CC mucosal function particularly in patients undergoing extended parenteral CC feeding or who, as a result of surgery, have undergone resection of the CC small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. CC disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP-2 analogues can be up CC to 10 to even 100 times more potent than GLP-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This peptide is a specifically claimed example of an analogue of a human C glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at CC least one amino acid substitution selected from: (a) incorporation at CC position 2 and/or 3 of an amino acid which renders the analogue resistant CC content of the cleavage by DPP-IV enzyme; (b) incorporation at position 10 of an amino acid which is oxidatively stable; and (c) incorporation at position CC 20 of an amino acid other than Arg. The peptides have intestinal growth CC promoting properties and can be used for treating conditions resulting CC from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption CC syndromes; and diseases and conditions caused by loss of small bowel CC mucogal function particularly in patients undergoing extended parenteral CC small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. CC GLP-2 analogues may be administered to patients with malabsorption CC the nutritional status of such patients. The GLP-2 analogues can be up CC to 10 to even 100 times more potent than GLP-2 analogues can be up
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This peptide is a specifically claimed example of an analogue of a rat CC glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at CC least one amino acid substitution selected from: (a) incorporation at CC position 2 and/or 3 of an amino acid which renders the analogue resistant CC continuous acid which is oxidatively stable; and (c) incorporation at position CC amino acid which is oxidatively stable; and (c) incorporation at position CC 20 of an amino acid other than Arg. The peptides have intestinal growth CC promoting properties and can be used for treating conditions resulting CC from the impaired growth or loss of such tissue. They can be used for treating conditions marked by abnormalities in the small intestinal tract CC mucosa, which include ulcers and inflammatory disorders; congenital or CC equired digestion and absorption disorders including malabsorption CC syndromes; and diseases and conditions caused by loss of small bowel CC small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. CC GLP-2 analogues may be administered to patients with malabsorption CC disorders so as to enhance the nutritional absorption and thereby improve the nutritional status of such patients. The GLP- 2 analogues can be up CC to 10 to even 100 times more potent than GLP-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Claim 13; Page 31; 38pp; English
```

This peptide is a specifically claimed example of an analogue of a human CC glucagon-like peptide (GLP)-2, where the GLP-2 analogue comprises at CC least one amino acid substitution selected from: (a) incorporation at CC position 2 and/or 3 of an amino acid which renders the analogue resistant CC to cleavage by DPP-IV enzyme; (b) incorporation at position 2 amino acid which is oxidatively stable; and (c) incorporation at position CC 20 of an amino acid other than Arg. The peptides have intestinal growth CC promoting properties and can be used for treating conditions resulting CC treating properties and can be used for treating conditions resulting CC treating conditions marked by abnormalities in the small intestinal tract CC mucosa, which include ulcers and inflammatory disorders; congenital or acquired digestion and absorption disorders including malabsorption CC syndromes; and diseases and conditions caused by loss of small bowel mucosal function particularly in patients undergoing extended parenteral CC feeding or who, as a result of surgery, have undergone resection of the CC small bowel and suffer from short-gut syndrome and cul-de-sac syndrome. CC GLP-2 analogues may be administered to patients with malabsorption CC the nutritional status of such patients. The GLP- 2 analogues can be up CC to 10 to even 100 times more potent than GLP-2 analogues can be up

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

```
A;Accession: A60323
A;Molecule type: protein
A;Residues: 53-81 CON>
A;Note: glucagon-37 was not completely sequenced
C;Superfamily: glucagon
C;Keywords: amidated carboxyl end; carbohydrate metabolism; duplication; hormone; p;1-20/Domain: signal sequence #status predicted <PGC>
F;21-180/Product: proglucagon #status predicted <PGC>
F;21-50/Region: glicentin-related peptide #status predicted
F;53-89/Product: glucagon-37 (oxyncomodulin) #status experimental <GG7>
F;93-81/Product: glucagon-like peptide 1 #status predicted <GG12>
F;16-170/Product: glucagon-like peptide 2 #status predicted <GG12>
F;16-170/Product: glucagon-like peptide 2 #status predicted <GG12>
F;127/Modified site: amidated carboxyl end (Arg) (amide in mature form from follow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ke peptide 1 (tGLP1)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 glucagon precursor - bullfrog (fragments)

N;Alternate names: oxyntomodulin

N;Contains: glucagon; glucagon-like peptide 1; glucagon-like
C;Species: Rana cateabeiana (bullfrog)
C;Date: 31-Mar-1993 #sequence_revision 31-Mar-1993 #text_change 20-Mar-1998
C;Accession: B28091; C28091; D28091

A;Title: A glucagon-like peptide, structurally related to mammalian oxyntomod: A;Reference number: A27885; MUID:88024141; PMID:3311036

A;Recession: A27885

A;Molecule type: protein

A;Residues: 1-36 <CONS

A;Cross-references: UNIPROT:P09682

A;Cross-references: UNIPROT:P09682

A;Experimental source: pancreatic islet X-cells
C;Comment: This form of proglucagon has not been completely processed to the c;Superfamily: glucagon
C;Kupwords: carbohydrate metabolism; duplication; hormone; pancreas
F;1-36/Product: glucagon-36 (oxyntomodulin) #status experimental <G36>
F;1-29/Product: glucagon #status predicted <GCN>
                                                                                                                                                                                                                                                                                                                                                                                           glucagon-36 - spotted ratfish

N;Alternate names: oxyntomodulin

N;Contains: glucagon; glucagon-36 (oxyntomodulin)

C;Species: Hydrolagus colliei (spotted ratfish)

C;Date: 31-Dec-1988 #sequence_revision 31-Mar-199

C;Accession: A27885
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             吊
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Cross-references: EMBL:U19918; NID:g736373; PIDN:AAC60212.1; C;Genetics:

Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satisty and stimulation of glucose disposal in

                                                                                                                                                                                                                                                                                           cell proliferation (By similarity).

FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LTSH, CRH, oxytocin, and vasopressin secretion. Increases islet TSH, CRH, oxytocin, and vasopressin secretion and pancreatic beta mass through stimulation of islet neogenesis and pancreatic beta

       FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

FUNCTION: GLD-1 is a potent stimulator of glucose-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3

    -!- FUNCTION: Glicentin may modulate

                                                                                         specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bloactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranalational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gastrointestinal tract. GLP1 and GLP2 are also secreted in selected neurons in the brain.

INDUCTION: Glucagon release is stimulated by hypoglycemia and inhibited by hyperglycemia, insulin, and somatostatin. GLP-1 GLP-2 are induced in response to nutrient ingestion (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gastro-pyloro-duodenal activity.
SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Glucagon is secreted in the A cells of the islets of Langerhans. GLP-1, GLP-2, oxyntomodulin and glicentin are secreted from entercendocrine cells throughout the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decrease mucosal permeability (By similarity). FUNCTION: Oxyntomodulin significantly reduces food intake (By interface).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gastrointestinal tract, from the stomach to the colo
principal target for GLP-2 action. Plays a key role
homeostasis, enhancing nutrient assimilation through
SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cell proliferaton (By similarity).

FUNCTION: GLP-2 Stimulates intestinal growth and up-regulates FUNCTION: GLP-2 Stimulates intestine, concomitant with increased villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    similarity).

and decreasing glycolysis. A counterregrates plasma glucose levels in respons hypoglycemia (By similarity). FUNCTION: GLP-1 is a potent stimulator insulin release. Play important roles constructions.
                                                                                                                                                    homeostasis. Regulates blood
                                                                                                                         glucose by increasing gluconeogenesis counterregulatory hormone of insulin,
                                                                                           response
                                                                                                 ç
                                                                                                 insulin-induced
```

- insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta cell proliferation (By similarity).

 -!- FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestinal growth are apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced
- gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and deconcosal permeability (By similarity).
- similarity).
 FUNCTION: Glicentin may modulate FUNCTION: Oxyntomodulin significantly reduces food intake (By
- gastro-pyloro-duodenal activity SUBCELLULAR LOCATION: Secreted. activity e gastric (By simil stric acid s similarity) secretion
- + +
- INDUCTION: Glucagon release is stimulated inhibited by hyperglycemia, insulin, and gGLP-2 are induced in response to nutrient d by hypoglycemia somatostatin. GL (By GLP-1 and and
- PTM: Proglucagon is posttranslationally processed in a tissue specific manner in pancreatic A cells and intestinal L cells pancreatic A cells, the major bioactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is similarity).

 PTM: Proglucagon is posttranslationally specific manner in pancreatic A cells are further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36)amide The C-terminal amidation is neither important for the metabolism GLP-1 nor for its effects on the endocrine pancreas θy H
- similarity).
 SIMILARITY: Belongs to the glucagon family.

-i-FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decreases mucosal permeability (By similarity).

-I-FUNCTION: Oxyntomodulin significantly reduces food intake (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        REVIEW.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and decreasing glycolysis. A counterregulatory wall and decreasing glycolysis. A counterregulatory wall and decreasing glycolysis in response to insulin-induced hypoglycemia (By similarity).

FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satisty and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TOTH OXYTOCIN, and vasopressin secretion. Increases islet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PTW: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bloactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 ilberates GLP-1, GLP-2, glicentin and oxyncomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       INDUCTION: Glucagon release is stimulated by hypoglycemia inhibited by hyperglycemia, insulin, and somatostatin. GLF-2 are induced in response to nutrient ingestion (By

REP PLANE PLANE BY NMR OF GLUCAGON ANTAGONIST.

REP PLANE SOLUTION STRUCTURE OF THE GLUCAGON ANTAGONIST [desHisl, desPhe6, RT Glu9]glucagon antide in the presence of perdeuterated dodecylphosphocholine micelles.";

RI Glu9]glucagon amide in the presence of perdeuterated dodecylphosphocholine micelles.";

RI Biochemistry 42:2825-2835(2003).

CC -1- FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, and hypoglycemia. Plays an important role in initiating and maintaining hyperglycemic conditions in diabetes.

CC -1- FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet

Inhibits beta cell apoptosis.

FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mucosal permeability.

Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disposal. Stimulates intestinal glucose transport and de mucosal permeability (By similarity). FUNCTION: Glicentin may modulate gastric acid secretion gastro-pyloro-duodenal activity (By similarity). SUBCELLULAR LOCATION: Secreted. TISSUB SPECIFICITY: Glucagon is secreted in the A cells islets of Langerhans. GLP-1, GLP-2, oxyntomodulin and gl are secreted from entercendocrine cells throughout the gastrointestinal tract. GLP1 and GLP2 are also secreted selected neurons in the brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PTM: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bioactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          INDUCTION: Glucagon release is stimulated inhibited by hyperglycemia, insulin, and s GLP-2 are induced in response to nutrient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             similarity)

                                                                                                                                                                                                                                                                                                                                -I- FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-I- FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satisty and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kieffer T.J., Habener J.F.; "The glucagon-like peptides."; Endocr. FUNCTION:
                                                                                                                                                                         FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased entercyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced
gastro-pyloro-duodenal

```
insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta cell proliferaton. Inhibits beta cell apoptosis.

-i-procedulation of inheratinal growth and up-regulates villus height in the small intestinal growth and up-regulates villus height in the small intestinal growth and corpassed crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient and decreases
                                                                                                                                                                                                                                                                                                                                                                                                      -!- FUNCTION: Oxyntomodulin significantly reduces
-!- FUNCTION: Glicentin may modulate gastric acid
gastro-pyloro-duodenal activity.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Glucagon is secreted in the islets of Langerhans GLP-1, GLP-2, oxyntomodulare secreted from enteroendocrine cells through
